

# ROPE ACCESS INSPECTION

FOR ALL YOUR INSPECTION NEEDS

Rope access is a form of work positioning, initially developed from techniques used in climbing and caving, which applies practical ropework to allow workers to access difficult-to-reach locations without the use of scaffolding, cradles or mobile elevated work platforms.

Dacon's staff are certified and bound by rigorous adherence to safety characteristics developed and controlled by IRATA International.

All types of inspection can be performed using rope access, providing huge time and cost savings to customers. Rope access has been in the inspection sector probably for longer than it has been in any other. This is probably because no machine or cradle can navigate a tubular steel construction better than a rope access technician.

Through rope access we are able to offer our clients a thorough means of inspection due to the ability to closely access and inspect all areas of a structure.

We are also able to supply our clients with feedback via digital video and digital still media, as well as in report form.
