FOR ALL YOUR INSPECTION NEEDS

## Heat Detection by Infrared Camera

Heat can be detected on the surface of every kind of materials, but it is more difficult to inspect glossy/shiny materials or stainless steel.

Advantages of heat detection by infrared camera are that it can prevent damages which may occur to the industrial factory.

1. Reduce the risk of conflagration
2. Reduce the amount of energy lost
3. Extend the life of electrical equipments and machines
4. Infrared Camera can function without inspector's contact which makes it safe and convenient to use.
5. Reduce the damages and other problems that may occur due to machines being inoperative.
