

# VISUAL INSPECTION

FOR ALL YOUR INSPECTION NEEDS

Visual Inspection or Visual Testing (VT) requires eye contact with the object to be inspected, adequate lighting and most importantly a thorough understanding of the Code or Standard the object is to be inspected or certified to.

All VT is carried out by trained and certified inspectors with good knowledge of Refinery, Petrochemical, Power, Oil and Gas process equipment and represents both cost saving in the efficient utilization of highly skilled personnel that are able to find the defects or discontinuities one are looking for, or to quickly realize the acceptance of fault free objects.

Often visual inspection eliminates the need for further testing and associated costs.

Should additional testing or verification be required, the VT inspector will either have this at hand or be the person to advice for other more advanced inspection methods.

As a Third Party Inspection provider, Dacon Inspection Services can provide both verification and conformity certification, as well as general NDT Code and Standard Acceptance. Visual Inspection Reports are issued in English language (other languages on request) and confirm to Dacon Inspection Services QMS and ISO certification.
